MCG'S VERSIFY OPERATOR LOG (OPLOG)

OpLog provides a simple and flexible way to log events and activities, manage workflow, and achieve compliance with one tool, simplifying communication across an organization and enabling field personnel, control room operators, and managers to share information from a single platform. OpLog automates existing manual processes and eliminates errors, measurably improving operational efficiency and compliance. Hosted in MCG Energy's FedRAMP® Authorized, SOC and NIST SP 800-53 compliant Private Cloud

OpLog saves operators time and standardizes operations through automation to capture and record events as they occur, implement best practices through configured workflows, and alert / escalate to appropriate personnel.

_ OPERATOR LOGGING KEY EXAMPLES

- _ Check Sheets / Shift Turnovers
- _ Switching Orders
- _ Operating Instructions
- _ Simultaneous Operations (SIMOPS)
- _ Site Entry
- _ Safe Work Permits
- _ Work Permits
- _ Unit Trips
- _ Protection Relay (PRC-05)
- _ Call Outs
- _ Communications
- _ Start Up / Shut Down
- _ Job Hazard Analysis
- _ Lock Out / Tag Out

_ **WORKFLOW ENGINE** The Versify workflow engine configures and builds forms, workflow, and alerts / notifications notifications specific to the customer's business processes. Configurable workflows support any type of event captured in the control room, eliminating manual processes, spreadsheets, and paper forms. The customizable UI saves the time and expense of new development, reducing implementation time, minimizing risk, and enhancing best practices.

_ **OPERATOR LOG LISTINGS** Several logging screens facilitate situational awareness with tabular and graphical views of current and historical log events. Operator Log Listing, Log Calendar, and Log Gantt screens provide standardized functionality (filtering on any displayed field, sorting tickets, grouping outages, export capability, etc.). High flexibility and configurability allow administrators and users to define custom views of which fields to display, saved filters, and conditional formatting based on business rules.

_ **BUSINESS INTELLIGENCE** Integrated reporting capabilities use an embedded Business Intelligence (BI) engine, with standard reports and dashboards that summarize and report log detail. Ad hoc reporting is available to authorized users to develop additional reports as needed.

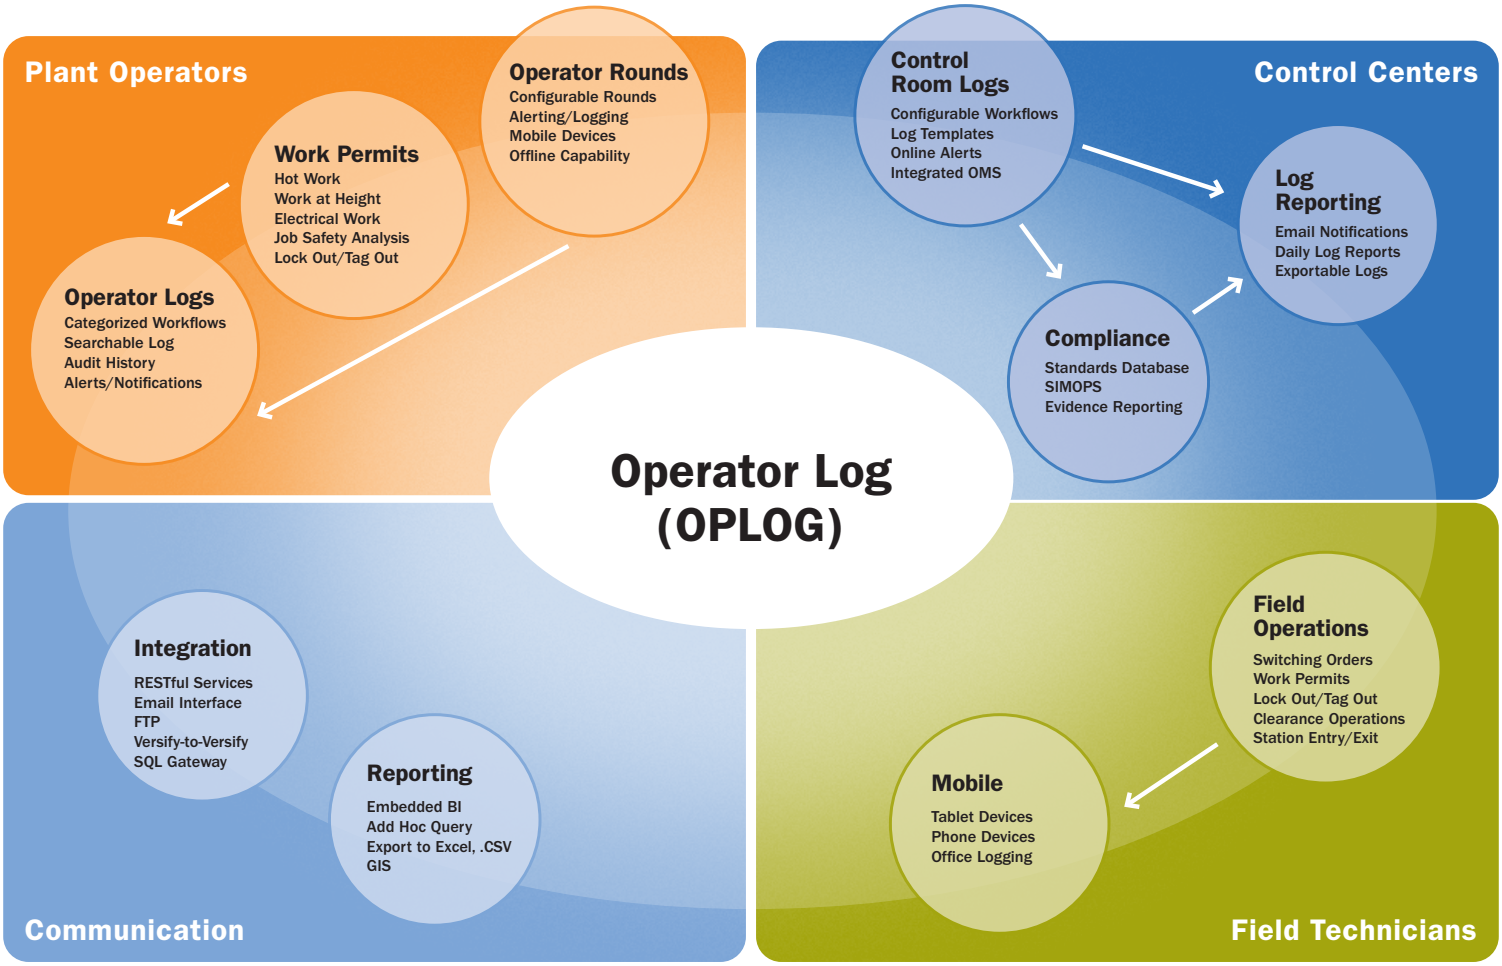
SOFTWARE OVERVIEW



KEY BENEFITS

- Workflows standardize control room operations
- Alerts and notifications improve situational awareness across your organization
- Dramatically reduces the time needed to complete processes
- Increase staff productivity through automation
- Refine and improve workflows as needed without new development
- Reduce risks of non-compliance with policies and procedures
